

## Product of the Month – Defraggler

### Use Defraggler to speed up your PC

#### Firstly though, what exactly is defragging and why do you need to do it?

"Defragging" is short for "defragmenting". Over time files in your operating system become fragmented. Defragmenting these files periodically will help to make your PC faster.

#### Can't I just use the built in Windows defrag tool?

The problem with this is it only allows you to defrag an entire drive. Defraggler lets you specify one or more files, folders, or the whole drive to defragment. And it's just as safe and robust as using the built in Windows tool.

#### Defraggler is compact and you can continue working whilst it's running

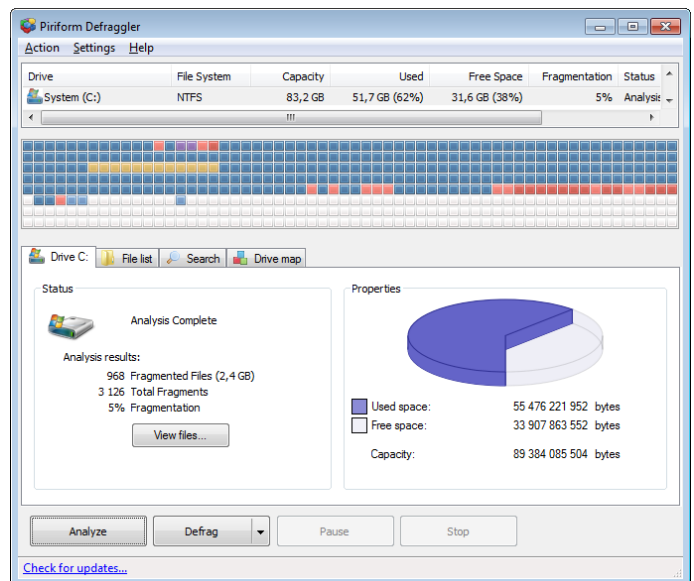

Some defrag programs literally take over your system and can take hours to run. Defraggler is small and uses few resources, so that you can keep working on your PC, without annoying slowdowns.

#### Defraggler has an interactive drive map

This means you can see how fragmented specific files are on your PC - before you defrag them.

You can see at a glance how much of your drive is fragmented, where those fragments are, and other aspects of your drive. The drive map is interactive, which means you can use it to identify specific groups of files.

You can select one or all files in a block to defragment. Defraggler's Interactive Drive Map gives you immediate graphical insight into what's on your drive.

#### You can schedule Defraggler to run while you sleep!

Defraggler lets you schedule its operation so that you can run it while you're not at your PC.

#### I'm convinced - I want to be a Defraggler! Where can I get it?

[Download Defraggler here](#) >

The basic program is free or there are Home and Business products as well. Priced at £19.95 and £29.95.
